

# Design Ideas:

I think that this design will be great as it can be used by both children and blind people.

I have placed braille on both the wooden base and on the wooden numbers. So the blind people can link up the number to the appropriate slot.

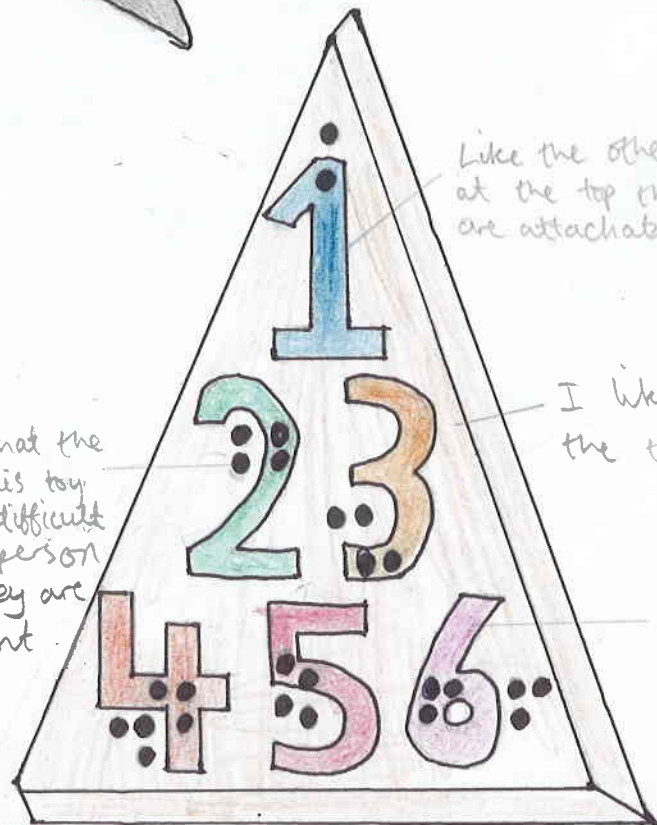

Although I like this idea I don't think I will carry it out.

make each piece colourful and a different colour.

Each piece is a piece to the zigzag.

I think that the braille on this toy may be more difficult for the blind person to find as they are jotted in different places.

Like the other design at the top the numbers are attachable.

I like the idea of the triangle design.

Numbers go up to 6 so there is a bit more for the child/blind person

each part of the bear ie the head will be the same size.

## Build A Bear

When I thought of this idea I just knew that it was a great idea.

will have different colours or characters for each bear

They are rods were each piece of the bear can slid on and off of.

This is a great game to help kids with their hand eye co-ordination skills

can be used for higher age groups up to 8.

The game is to throw the hoops onto the pole in the correct order.

use different shades of colours to attract the child
